

PIG LAUNCHER & RECIEVER

DESCRIPTION

The DHI pig launcher and receiving manifold is designed to safely and easily launch and receive full bore pigs without interrupting operations or disconnecting hoses or piping.

The 12-inch unit has a 16-inch launch and receiving cavity that can be isolated inline with a 12-inch gate valve, and flow bypassed and isolated with 8-inch butterfly valves. The tee's in the system are crossed with diversion bars to prevent pigs from unintentionally being sucked into any piping sections.

These units are easily deployed with the same deployment equipment used for the DHI's hose reel system.
